

DSFBA: Data Wrangling

Data Science for Business Analytics

- 1 Filter
- 2 Arrange
- 3 Select
- 4 Mutate
- 5 Summarize
- 6 The pipe operator
- 7 More on data manipulations
- 8 Tidy data

Most of the material (e.g., the picture above) is borrowed from R for data science

A grammar of data manipulation

- When working with data you must:
 - Figure out what you want to do.
 - Describe those tasks as a computer program.
 - Execute the program.
- The dplyr package makes this fast and easy with 5 verbs!
 - ▶ filter(): select observations based on their values.
 - arrange(): reorder the observations.
 - select(): select variables based on their names.
 - mutate(): add variables as functions of existing variables.
 - summarize(): collapse many values down to a single summary.
- Two important features:
 - Verbs can be used with group_by() to operate groupwise.
 - Verbs work similarly...
 - 1. First argument: a data frame.
 - 2. Other arguments: what to do with it using variable names.
 - 3. Result: a new data frame.

All 336,776 flights that departed from NYC in 2013 (US BTS):

```
nvcflights13::flights
#> # A tibble: 336.776 x 19
#>
       year month day dep_time sched_dep_time dep_delay arr_time
#>
      \langle int \rangle \langle int \rangle \langle int \rangle \langle int \rangle
                                              \langle int \rangle
                                                          <db1>
                                                                    \langle int \rangle
                                                                      830

                                                             -3
                                                                     838
#>
#> 10 2013
                                558
                                                600
                                                             -2
                                                                     753
#> # ... with 832 more rows, and 12 more variables:
#> #
     sched arr time <int>, arr delay <dbl>, carrier <chr>,
#> #
       flight <int>, tailnum <chr>, origin <chr>, dest <chr>,
#> # air time <dbl>. distance <dbl>. hour <dbl>. minute <dbl>.
       time hour <dttm>
#> #
```

Comparisons

- The standard suite: >, >=, <, <=, !=, and ==.
- Most common mistake:

```
filter(flights, month = 1)
```

■ What happens in the following?

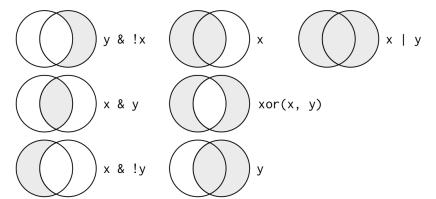

```
sqrt(2) ^ 2 == 2
#> [1] FALSE
1/49 * 49 == 1
#> [1] FALSE
near(sqrt(2) ^ 2, 2)
#> [1] TRUE
near(1 / 49 * 49, 1)
#> [1] TRUE
```

Logical operators

Multiple arguments to filter() are combined with:

- & for "and"
- I for "or"
- •! for "not"

What is this code doing?

```
filter(flights, month == 11 | month == 12)
```

What is this code doing?

```
filter(flights, month == 11 | month == 12)
```

- Literally "finds all flights that departed in November or December".
- ... filter(flights, month == 11 | 12) ?

What is this code doing?

```
filter(flights, month == 11 | month == 12)
```

- Literally "finds all flights that departed in November or December".
- ... filter(flights, month == 11 | 12) ?
- No, but a solution:

```
filter(flights, month %in% c(11, 12))
```

De Morgan's law

```
    !(x & y) is the same as !x | !y
    !(x | y) is the same as !x & !y
```

```
all.equal(
  filter(flights, !(arr_delay > 120 | dep_delay > 120)),
  filter(flights, arr_delay <= 120, dep_delay <= 120)
  )
#> [1] TRUE
```

- Helper functions you can use within select():
 - starts_with("abc"): matches names that begin with "abc".
 - ends_with("xyz"): matches names that end with "xyz".
 - contains("ijk"): matches names that contain "ijk".
 - matches("(.)\\1"): selects variables that match a regular expression (this one matches any variables that contain repeated characters).
 - num_range("x", 1:3) matches x1, x2 and x3.
- select() can be used to rename variables, but it drops all of the variables not explicitly mentioned. Instead, use rename()
- See ?select for more details.

Useful creation functions I

Any vectorized function would work, but frequently useful are:

- Arithmetic operators: +, -, *, /, ^.
 - Vectorized with "recycling rules" (e.g., air_time / 60).
 - Useful in conjunction with aggregate functions (e.g., x / sum(x) or y - mean(y)).
- Modular arithmetic: %/% (integer division) and %% (remainder), where x == y * (x %/% y) + (x %% y).
 - Allows you to break integers up into pieces (e.g., hour = dep time %/% 100 and minute = dep time %% 100)
- Logs: log(), log2(), log10().
 - Useful for data ranging across multiple orders of magnitude.
 - Convert multiplicative relationships to additive.

- Offsets: lead() and lag():
 - Refer to lead-/lagging values (e.g., compute running differences x lag(x) or find values change x != lag(x)).

```
x <- 1:10

lag(x)

#> [1] NA 1 2 3 4 5 6 7 8 9

lead(x)

#> [1] 2 3 4 5 6 7 8 9 10 NA
```

Cumulative aggregates: cumsum(), cumprod(), cummin(), cummax(), cummean().

```
cumsum(x)
#> [1] 1 3 6 10 15 21 28 36 45 55
cummean(x)
#> [1] 1.00 1.00 1.33 1.75 2.20 2.67 3.14 3.62 4.11 4.60
```

- Logical comparisons, <, <=, >, >=, !=
- Ranking functions: min_rank(), row_number(),
 dense_rank(), percent_rank(), cume_dist(), ntile()

```
y <- c(1, 2, 2, NA, 3, 4)
min_rank(y)

#> [1] 1 2 2 NA 4 5
min_rank(desc(y))

#> [1] 5 3 3 NA 2 1
row_number(y)

#> [1] 1 2 3 NA 4 5
dense_rank(y)

#> [1] 1 2 2 NA 3 4
percent_rank(y)

#> [1] 0.00 0.25 0.25 NA 0.75 1.00
cume_dist(y)

#> [1] 0.2 0.6 0.6 NA 0.8 1.0
```

Collapse values with summarize()

```
summarize(flights, delay = mean(dep_delay, na.rm = TRUE))
#> # A tibble: 1 x 1
#> delay
#> <dbl>
#> 1 12.6
```

summarize() paired with group_by()

```
by_day <- group_by(flights, year, month, day)</pre>
summarize(by_day, delay = mean(dep_delay, na.rm = TRUE))
#> `summarise()` regrouping output by 'year', 'month' (override with `.groups` a
#> # A tibble: 365 x 4
#> # Groups: year, month [12]
#> year month day delay
#> <int> <int> <int> <dbl>
#> 1 2013 1 1 11.5
#> 2 2013 1 2 13.9
#> 3 2013 1 3 11.0
#> 4 2013 1 4 8.95
#> 5 2013 1 5 5.73
#> 6 2013 1 6 7.15
#> 7 2013 1
              7 5.42
#> 8 2013 1 8 2.55
#> 9 2013 1 9 2.28
#> 10 2013 1 10 2.84
#> # ... with 355 more rows
```

#> 9 2013
#> 10 2013
                  19 47.9 46.1
#> # ... with 39 more rows
```

- x %>% f is equivalent to f(x)
- x %>% f(y) is equivalent to f(x, y)
- $\mathbf{x} \%\%$ f(y) %>% g(z) is equivalent to g(f(x, y), z)

```
x <- 1:10

y <- x + 1

z <- y + 1

f <- function(x, y) x + y

x %>% sum

#> [1] 55

x %>% f(y)

#> [1] 3 5 7 9 11 13 15 17 19 21

x %>% f(y) %>% f(z)

#> [1] 6 9 12 15 18 21 24 27 30 33
```

 $\mathbf{x} \%\% \mathbf{f}(y, .)$ is equivalent to $\mathbf{f}(y, x)$

Function composition

- Each of the three options has its own strengths and weaknesses:
 - Nesting, f(g(x)):
 - Concise, and well suited for short sequences.
 - Longer sequences harder to read (inside out & right to left).
 - Arguments can get spread out over long distances (see Dagwood sandwich).
 - Intermediate objects, y <- f(x); g(y):</p>
 - Requires you to name intermediate objects.
 - A strength when objects are important, but a weakness when values are truly intermediate.
 - Piping, x %>% f() %>% g():
 - Allows to read code in straightforward left-to-right fashion.
 - Doesn't require to name intermediate objects.
 - Only for linear sequences of transformations of a single object.
- Most code use a combination of all three styles, but...
- Piping is more common in data analysis code!

Outline

- 1 Filter
- 2 Arrange
- 3 Select
- 4 Mutate
- 5 Summarize
- 6 The pipe operator
- 7 More on data manipulations
- 8 Tidy data

An alternative to na.rm: pre-filter

```
not_cancelled <- flights %>%
 filter(!is.na(dep_delay), !is.na(arr_delay))
not cancelled %>%
 group_by(year, month, day) %>%
 summarize(mean = mean(dep_delay))
#> # A tibble: 365 x 4
#> # Groups: year, month [12]
#>
  year month day mean
\#> <int><int><int><int><dbl>>
#> 1 2013 1 1 11.4
#> 2 2013 1 2 13.7
#> 3 2013 1 3 10.9
#> 4 2013 1 4 8.97

#> 9 2013 1
                             2252
#> 10 2013
               10
                             2320
#> # ... with 355 more rows
```

Useful summary functions III

■ Counts: n(x), sum(!is.na(x)), n_distinct(x).

```
not cancelled %>%
 group_by(dest) %>%
  summarize(carriers = n_distinct(carrier)) %>%
 arrange(desc(carriers))
#> # A tibble: 104 x 2
#> dest carriers
\#> < chr> < int>
#> 1 ATT.
#> 2 BOS
#> 3 CLT
#> 4 ORD
#> 5 TPA
#> 6 AUS
#> 7 DCA
#> 8 DTW
#> 9 TAD
#> 10 MSP
#> # ... with 94 more rows
```

Useful summary functions IV

A simple helper function for counts:

```
not_cancelled %>% count(dest)
#> # A tibble: 104 x 2
  dest
#>
  \langle chr \rangle \langle int \rangle
#> 1 ABQ 254
#> 2 ACK 264
#> 3 ALB 418
#> 4 ANC
#> 5 ATL 16837
#> 6 AUS 2411
#> 7 AVL 261
#> 8 BDL 412
#> 9 BGR 358
#> 10 BHM 269
#> # ... with 94 more rows
```

Useful summary functions V

Counts with an optional weight variable:

```
not_cancelled %>% count(tailnum, wt = distance)
#> # A tibble: 4,037 x 2
     t, a, i, 1, n, u, m
#>
   <ch.r> <dh1.>
#>
#>
   1 D942DN 3418
#> 2 NOEGMQ 239143
#>
   3 N10156 109664
   4 N102UW 25722
#>
#> 5 N103US 24619
#> 6 N104UW 24616
#> 7 N10575 139903
#> 8 N105UW 23618
#> 9 N107US 21677
#> 10 N108UW 32070
#> # ... with 4,027 more rows
```

Useful summary functions VI

• Counts of logical values: e.g., sum(x > 10).

```
not cancelled %>%
 group_by(year, month, day) %>%
 summarize(n_early = sum(dep_time < 500))</pre>
#> # A tibble: 365 x 4
#> # Groups: year, month [12]
#> year month day n early
\#> <int><int><int><int><
#> 1 2013 1 1
#> 2 2013 1
#> 3 2013 1 3
#> 4 2013 1 4
#> 5 2013 1
#> 6 2013 1 6
#> 7 2013 1 7
#> 8 2013 1 8
#> 9 2013 1 9
#> 10 2013 1 10
#> # ... with 355 more rows
```

Useful summary functions VII

Proportions of logical values: e.g., mean(y == 0).

```
not cancelled %>%
 group_by(year, month, day) %>%
 summarize(hour_perc = mean(arr_delay > 60))
#> # A tibble: 365 x 4
#> # Groups: year, month [12]
#> year month day hour perc
\#> <int><int><int><<int><<dbl>>
#> 1 2013 1 1 0.0722
#> 2 2013 1 2 0.0851
#> 3 2013 1 3 0.0567
#> 4 2013 1
                 4 0.0396
#> 5 2013 1
             5 0.0349
#> 6 2013 1 6 0.0470
#> 7 2013 1 7 0.0333
#> 8 2013 1
             8 0.0213
#> 9 2013 1
             9 0.0202
#> 10 2013
            1 10 0.0183
#> # ... with 355 more rows
```

Grouping by multiple variables I

```
daily <- group_by(flights, year, month, day)</pre>

What makes a dataset tidy?

Three interrelated rules:

- Each variable must have its own column.
- Each observation must have its own row.
- Each value must have its own cell.

Because it's impossible to only satisfy two of the three:

- Put each dataset in a tibble.
- Put each variable in a column.

Why ensure that your data is tidy?

■ Why?

- With consistent data structure, it's easier to learn the tools that work with it because they have an underlying uniformity.
- ▶ Placing variables in columns allows R's vectorized nature to shine.
- Tidy data principles seem obvious, BUT:
 - Most people aren't familiar with them.
 - Data often organized to facilitate something different than analysis.
- Hence, you'll most likely need to do some tidying.

The two steps of tidying

- Figure out what the variables and observations are.
- Resolve one of two common problems:
 - One variable might be spread across multiple columns.
 - One observation might be scattered across multiple rows.

... To fix these problems, you'll need pivot_longer() and pivot_wider().

Longer with pivot_wider()

```
table4a %%

pivot_longer(c(`1999`, `2000`),

names_to = "year",

values_to = "cases")

#> # A tibble: 6 x 3

#> country year cases

#> <chr> <chr> <chr> <int> #> 1 Afghanistan 1999 745

#> 2 Afghanistan 2000 2666

#> 3 Brazil 1999 37737

#> 4 Brazil 2000 80488

#> 5 China 1999 212258

#> 6 China 2000 213766
```

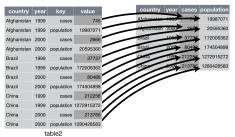

country	year	cases	country	1999	2000
Afghanistan	1999	745	Afghanistan	745	2 666
Afghanistan	2000	2666	Brazil	37737	80488
Brazil	1999	37737	China	212258	213766
Brazil	2000	80488			
China	1999	212258			
China	2000	213766		table4	

Wider with pivot_wider()

```
table2
#> # A tibble: 12 x /
      country
                   year type
                                          count
                  <int> <chr>
      <chr>>
                                          \langle i, n, t, \rangle

table6

- A value can be missing in one of two possible ways:
 - Explicitly, i.e. flagged with NA.
 - **Implicitly**, i.e. simply not present in the data.

"An explicit missing value is the presence of an absence; an implicit missing value is the absence of a presence." Hadley Wickham

Are there missing values in this dataset?

```
stocks <- tibble(
  year = c(2015, 2015, 2015, 2015, 2016, 2016, 2016),
  qtr = c( 1,  2,  3,  4,  2,  3,  4),
  return = c(1.88, 0.59, 0.35,  NA, 0.92, 0.17, 2.66)
)</pre>
```

Implicit to explicit and conversely

Implicit to explicit:

Explicit to implicit:

```
stocks %>%
  pivot_wider(names_from = year,
              values from = return) %>%
 pivot_longer(
    cols = c(`2015`, `2016`),
    names to = "year",
    values to = "return".
    values drop na = TRUE
#> # A tibble: 6 x 3
